Bodily modeling with representation Bodily modeling with representation is an emerging and growing field, however, significant research and development of this work is still needed to support a robust, computer-supported method. Introduction Bodily modeling is an enabling technology for the engagement of adults with severe cognitive and/or physical impairments, including children and adults who have life-threatening illnesses (St. Jean, 2007), as it allows them to actively use computer-generated models based upon their own bodies. A body-modeling program is a graphics application that allows an individual to easily create a graphically-defined digital model of their own anatomy based upon conventional medical images, such as X-ray, CT, MRI, and ultrasound images. These models can then be manipulated, viewed in any number of ways, and shared with others. In the present study, we conducted a more detailed examination of the literature to understand the trajectory of advances in body-modeling applications, particularly as applied to individuals with special needs. Research As illustrated in the growth chart of the emergence of body-modeling techniques, it appears that techniques for using body modeling to address simple functions are still evolving from very rudimentary "brush" tools used in the 1970s (Table 1) through the early 1990s, when the first applications that used stereolithographic printers emerged (Mills and Schloetterer, 1991) (Figure 1). In the last decade and a half, software and hardware development has led to a plethora of body-modeling-enabling tools. In addition, several 50b96ab0b6
